## Control Systems

Subject Code: BEC-26

## Unit-III

Shadab A. Siddique
Assistant Professor

Third Year ECE

Maj. G. S. Tripathi Associate Professor

## Lecture 1

Department of Electronics \& Communication Engineering, Madan Mohan Malaviya University of Technology, Gorakhpur

## UNIT - III

Time response of continuous data systems, Different test Signals for the time response, Unit step response and Time-Domain Specifications, Time response of a first-order and second order systems for different test signals, Steady State Error and Error constants, Sensitivity, Control Actions: Proportional, Derivative, Integral and PID control.
$\checkmark$ Time Response of a Continuous data systems/ Time Domain Analysis
$\checkmark$ Transient and Steady State Response
$\checkmark$ Standard Test Signal : Step, Ramp, Parabolic and Impulse, Need, Significance and corresponding Laplace Representation
$\checkmark$ Poles and Zeros: Definition, S-plane representation
$\checkmark$ First Order Control System : Analysis for step Input, Concept of Time Constant
$\checkmark$ Second Order Control System : Analysis for step input, Concept, Definition and effect of damping
$\checkmark$ Time Response Specifications (no derivations )
$\checkmark \mathrm{Tp}, \mathrm{Ts}, \mathrm{Tr}, \mathrm{Td}, \mathrm{Mp}$, ess - problems on time response specifications
$\checkmark$ Steady State Analysis - Type 0, 1, 2 system,
$\checkmark$ steady state error constants, problems
$\checkmark$ Control Actions: Proportional, Derivative, Integral, PI, PD and PID control Shadab actionna

## Time Response

$>$ In time domain analysis, time is the independent variable. When a system is given an excitation, there is a response (output).
$>$ Definition: The response of a system to an applied excitation is called "Time Response" and it is a function of $\mathrm{c}(\mathrm{t})$.

## > Time Response - Example

The response of motor's speed when a command is given to increase the speed is shown in figure,

As seen from figure, the motors speed gradually picks up from 1000 rpm and moves towards 1500 rpm . It overshoots and again corrects itself and finally settles down at the last value

## Time Response

Generally speaking, the response of any system thus has two parts
(i) Transient Response
(ii) Steady State Response
$>$ That part of the time response that goes to zero as time becomes very large is called as "Transient Response"

$$
\text { i.e. } \quad \underset{t \rightarrow \infty}{L} c(\mathrm{t})=0
$$

$>$ As the name suggests that transient response remains only for some time from initial state to final state.
$>$ From the transient response we can know;
$\checkmark$ When system begins to respond after an input is given.
$\checkmark$ How much time it takes to reach the output for the first time.
$\checkmark$ Whether the output shoots beyond the desired value \& how much.
$\checkmark$ Whether the output oscillates about its final value.
$\checkmark$ When does it settle to the final value.

## Steady State Response

$>$ That part of the response that remains after the transients have died out is called "Steady State Response".

## $>$ From the steady state we can know;

$\checkmark$ How long it took before steady state was reached.
$\checkmark$ Whether there is any error between the desired and actual values.
$\checkmark$ Whether this error is constant, zero or infinite i.e. unable to track the input.

## Standard Test Signal

$>$ It is very interesting fact to know that most control systems do not know what their inputs are going to be.
> Thus system design cannot be done from input point of view as we are unable to know in advance the type input

## Need of Standard Test Signal

$>$ From example;
$\checkmark$ When a radar tracks an enemy plane the nature of the enemy plane's variation is random.
$\checkmark$ The terrain, curves on road etc. are random for a drives in an automobile system.
$\checkmark$ The loading on a shearing machine when and which load will be applied or thrown of.

## Need of Standard Test Signal

$>$ Thus from such types of inputs we can expect a system in general to get an input which may be;
a) A sudden change
b) A momentary shock
c) A constant velocity
d) A constant acceleration
$>$ Hence these signals form standard test signals. The response to these signals is analyzed. The above inputs are called as,
a) Step input - Signifies a sudden change
b) Impulse input - Signifies momentary shock
c) Ramp input - Signifies a constant velocity
d) Parabolic input - Signifies constant acceleration

## Standard Test Signal

## Step Input

Mathematical Representations

Graphical Representations

This signal signifies a sudden change in the reference input $r(t)$ at time $t=0$
Laplace Representations
$L\{\mathrm{Ru}(\mathrm{t})\}=\frac{\mathrm{R}}{\mathrm{S}}$

## Unit Step Input

Mathematical Representations
Graphical Representations

$$
\begin{array}{rlrl}
r(t)= & 1 \cdot u(t) & t>0 \\
& =0 & t<0
\end{array}
$$

This signal signifies a sudden change in the reference input $\mathrm{r}(\mathrm{t})$ at time $\mathrm{t}=0$
$\underline{\text { Laplace Representations }} L\{\mathrm{u}(\mathrm{t})\}=\frac{1}{\mathrm{~S}}$

## Standard Test Signal

## Ramp Input

Mathematical Representations

$$
\begin{align*}
r(t) & =R . t & & t>0 \\
& =0 & & t<0
\end{align*}
$$

Graphical Representations

Signal have constant velocity i.e. constant change in it's value w.r.t. time
Laplace Representations

## Unit Ramp Input

Mathematical Representations

$$
\begin{align*}
r(t) & =1 . t & & t>0 \\
& =0 & & t<0
\end{align*}
$$

If $\mathrm{R}=1$ it is called a unit ramp input

$$
L\{\mathrm{Rt}\}=\frac{R}{S^{2}}
$$

Graphical Representations

$$
L\{\mathrm{Rt}\}=\frac{1}{S^{2}}
$$

## Standard Test Signal

## Parabolic Input

Mathematical Representations

$$
\begin{aligned}
\mathrm{r}(\mathrm{t}) & =\frac{R t^{2}}{2} & & \mathrm{t}>0 \\
& =0 & & \mathrm{t}<0
\end{aligned}
$$

Laplace Representations $L\{\mathrm{R} \mathrm{t}\}=\frac{R}{S^{3}}$
Impulse Input
Mathematical Representations

$$
\begin{aligned}
r(t) & =\delta(t)=1 & & t>0 \\
& =0 & & t<0
\end{aligned}
$$

## Graphical Representations

Graphical Representations

The function has a unit value only for $\mathrm{t}=0$. In practical cases, a pulse whose time approaches zero is taken as an impulse function.

Laplace Representations $L\{\delta(\mathrm{t})\}=1$

## Poles \& Zeros of Transfer Function

The transfer function is given by,

$$
G(\mathrm{~s})=\frac{C(\mathrm{~s})}{R(s)}
$$

Both $\mathrm{C}(\mathrm{s})$ and $\mathrm{R}(\mathrm{s})$ are polynomials in s

$$
\begin{aligned}
\therefore G(\mathrm{~s}) & =\frac{b_{m} s^{m}+b_{m-1} s^{m-1}+\ldots \ldots \ldots \ldots+b_{o}}{s^{n}+a_{n-1} s^{n-1}+\ldots \ldots \ldots \ldots \ldots+a_{n}} \\
& =\frac{K\left(\mathrm{~s}-\mathrm{b}_{1}\right)\left(\mathrm{s}-\mathrm{b}_{2}\right)\left(\mathrm{s}-\mathrm{b}_{3}\right) \ldots \ldots \ldots \ldots\left(\mathrm{s}-\mathrm{b}_{\mathrm{m}}\right)}{\left(\mathrm{s}-a_{1}\right)\left(\mathrm{s}-a_{2}\right)\left(\mathrm{s}-a_{3}\right) \ldots \ldots \ldots \ldots\left(\mathrm{s}-a_{n}\right)}
\end{aligned}
$$

Where, $K=$ system gain
$\mathrm{n}=$ Type of system
> Poles: The values of ' s ', for which the transfer function magnitude $|\mathrm{G}(\mathrm{s})|$ becomes infinite after substitution in the denominator of the system are called as "Poles" of transfer function.
$>$ Zeros: The values of 's', for which the transfer function magnitude $|\mathrm{G}(\mathrm{s})|$ becomes zero after substitution in the numerator of the system are called as "Zeros" of transfer function.

## Pole- Zero Plot

$>$ The diagram obtained by locating all poles and zeros of the transfer function in the splane is called as "Pole-zero plot".
$>$ The s-plane has two axis real and imaginary. Since $s=\sigma+j \omega$, the X-axis stands for real axis and shows a value of $\sigma$
$\Rightarrow$ Similarly, Y-axis stands for $j \omega$ and represents the imaginary axis.

## Characteristics Equation

Definition: The equation obtained by equating the denominator polynomial of a transfer function to zero is called as the "Characteristics Equation"

$$
s^{n}+a_{n-1} s^{n-1}+a_{n-2} s^{n-2} \quad+\ldots \ldots \ldots \ldots \ldots+a_{n}
$$

## Example 1

For the given transfer function,

$$
\mathrm{T} . F .=\frac{K(\mathrm{~s}+6)}{s(\mathrm{~s}+2)(\mathrm{s}+5)\left(\mathrm{s}^{2}+7 \mathrm{~s}+12\right)}
$$

Find: (i) Poles
(iii) Pole-zero Plot
(ii)Zeros
(iv) Characteristics Equation

## Solution: (i)Poles

The poles can be obtained by equating denominator with zero

$$
\begin{aligned}
& \frac{s(\mathrm{~s}+2)(\mathrm{s}+5)\left(\mathrm{s}^{2}+7 \mathrm{~s}+12\right)=0}{\therefore s=0} \\
& \therefore \mathrm{~s}+2=0 \quad \therefore \mathrm{~s}=-2 \\
& \therefore \mathrm{~s}+5=0 \quad \therefore \mathrm{~s}=-5
\end{aligned}
$$

## Example 1

$$
\begin{gathered}
s(\mathrm{~s}+2)(\mathrm{s}+5)\left(\mathrm{s}^{2}+7 \mathrm{~s}+12\right)=0 \\
\left(\mathrm{~s}^{2}+7 \mathrm{~s}+12\right)=(\mathrm{s}+3)(\mathrm{s}+4) \\
\therefore \mathrm{s}+3=0 \quad \therefore \mathrm{~s}=-3 \\
\therefore \mathrm{~s}+4=0 \quad \therefore \mathrm{~s}=-4
\end{gathered}
$$

The poles are $s=0,-2,-3,-4,-5$
(ii) Zeros:

The zeros can be obtained by equating numerator with zero

$$
\mathrm{s}+6=0 \quad \therefore \mathrm{~s}=-6
$$

The zeros are $s=-6$

## Example 1

## (iii) Pole-zero plot:

 $j \omega$

## Example 1

## (iv) Characteristics Equation:

$$
\begin{gathered}
s(\mathrm{~s}+2)(\mathrm{s}+5)\left(\mathrm{s}^{2}+7 \mathrm{~s}+12\right)=0 \\
s\left(\mathrm{~s}^{2}+7 \mathrm{~s}+10\right)\left(\mathrm{s}^{2}+7 \mathrm{~s}+12\right)=0 \\
\therefore\left(\mathrm{~s}^{3}+7 \mathrm{~s}^{2}+10 \mathrm{~s}\right)\left(\mathrm{s}^{2}+7 \mathrm{~s}+12\right)=0 \\
\therefore \mathrm{~s}^{5}+7 \mathrm{~s}^{4}+12 \mathrm{~s}^{3}+7 \mathrm{~s}^{4}+49 \mathrm{~s}^{3}+84 \mathrm{~s}^{2}+10 \mathrm{~s}^{3}+70 \mathrm{~s}^{2}+120 \mathrm{~s}=0 \\
\therefore \mathrm{~s}^{5}+14 \mathrm{~s}^{4}+71 \mathrm{~s}^{3}+154 \mathrm{~s}^{2}+120 \mathrm{~s}=0
\end{gathered}
$$
